Weekly Internship Assignment 5

Website Chosen: Flipkart **Website Link:** https://www.flipkart.com/

Introduction

E-commerce platforms rely heavily on user experience to drive purchases and reduce cart abandonment. Even small usability problems in product pages or checkout flows can lead to significant revenue loss.

This study evaluates the UX of the Flipkart e-commerce platform and proposes improvements to enhance conversion rates and usability. The analysis is supported by previous UX research and case studies that highlight common problems in online shopping experiences such as complicated checkout processes and lack of transparency.

The report applies several UX methodologies including funnel analysis, CTA clarity review, heuristic evaluation, and checkout flow mapping.

Product Page Evaluation

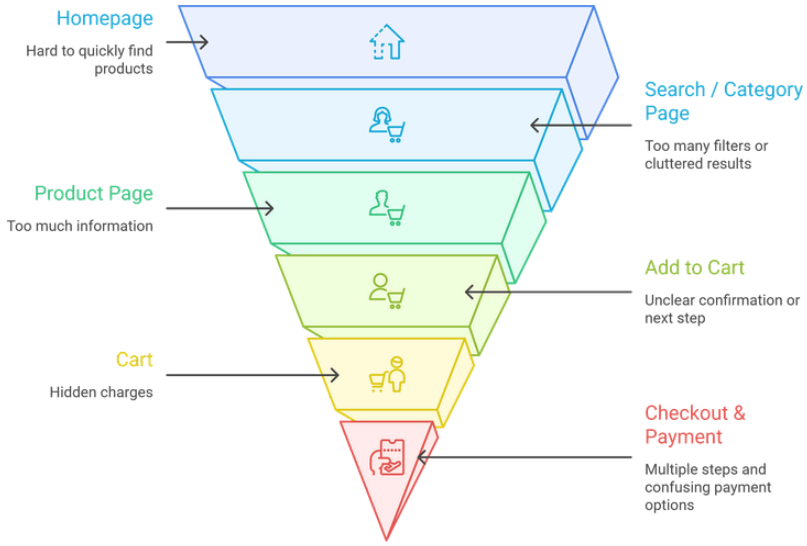
Example Observations

Element	Current UX	Issue	Improvement
Product images	Multiple images	No quick comparison view	Add carousel preview
Price display	Shows discount	Discount info cluttered	Simplify price hierarchy
Reviews	Rating visible	Reviews hidden below fold	Move highlights near title
CTA	Add to Cart + Buy Now	Competing actions	Clear primary CTA

Explanation: Product pages should quickly communicate product value and trust signals. When users must scroll extensively to locate reviews or specifications, the decision-making process becomes slower and more frustrating.

Funnel Analysis

Flipkart's Friction Funnel: From Homepage to Checkout:



Industry studies show that cart abandonment is often caused by hidden costs and complicated checkout flows, which increase user frustration.

Cart Page UX Analysis

Current Issues

1. Hidden shipping costs
2. Multiple checkout steps
3. Limited trust indicators

These factors can increase cart abandonment and reduce conversion.

Research on Flipkart's cart redesign suggests that **simplicity, transparency, and trust are key pillars of better checkout experiences.**

Cart Optimization Proposal

UX Problem #1 — Complex Multi-Step Checkout

Why this is a problem

Research on Flipkart cart redesign shows that long checkout processes and forced login are major reasons for cart abandonment.

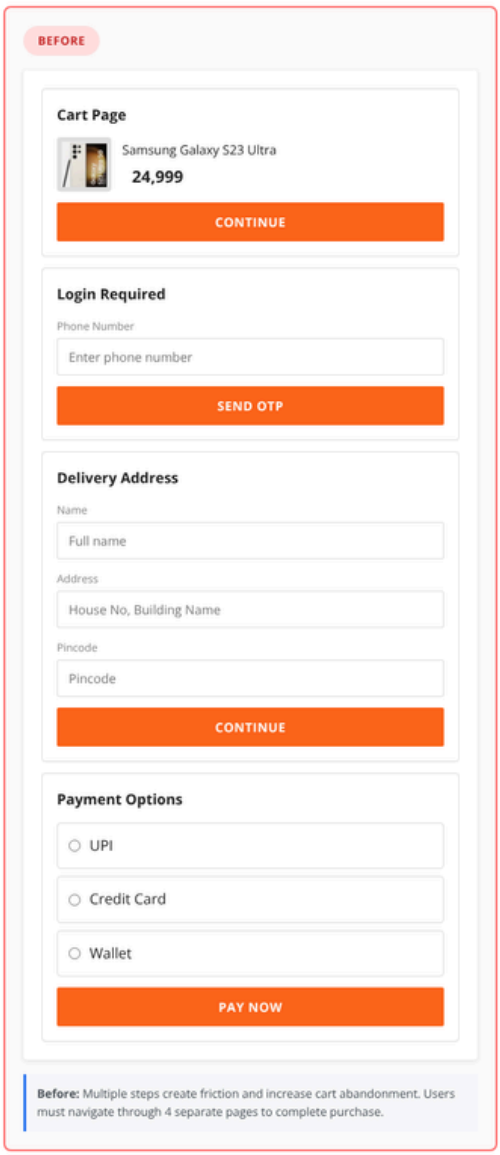
Users get frustrated when they must:

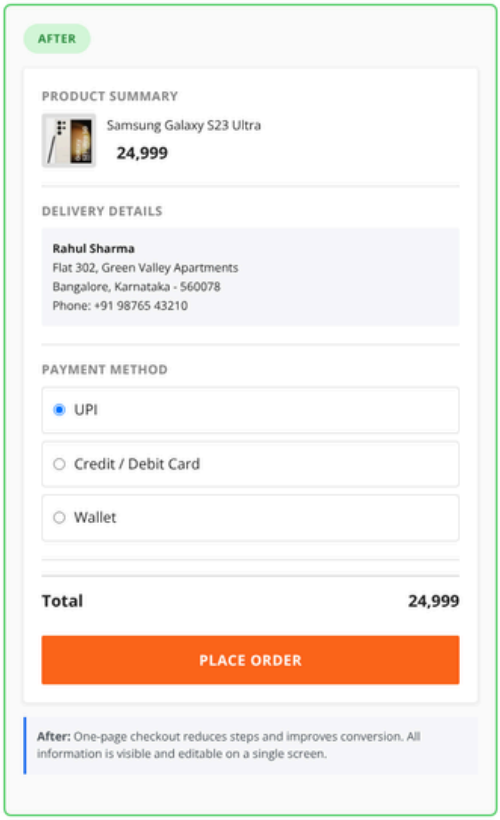
- Login first
- Fill address on a separate page
- Review order on another page

Industry data suggests complicated checkouts increase abandonment significantly.

Problems:

- Too many steps
- Forced login
- Unclear progress





Benefits

- Fewer clicks
- Faster checkout
- Clearer order summary

One-page checkout reduces friction and improves completion rates.

Additional Info: These are just conceptual ideas and mockups, not final or definitive solutions. As the assignment suggests, they are meant for brainstorming and inspiration, not necessarily the best or most complete designs.
While login is required for security and data protection, these ideas explore alternative ways to verify users, auto-fill previous data, and streamline the experience. This is purely for ideation and does not replace existing security requirements.

UX Problem #2 — Hidden Charges & Pricing Confusion

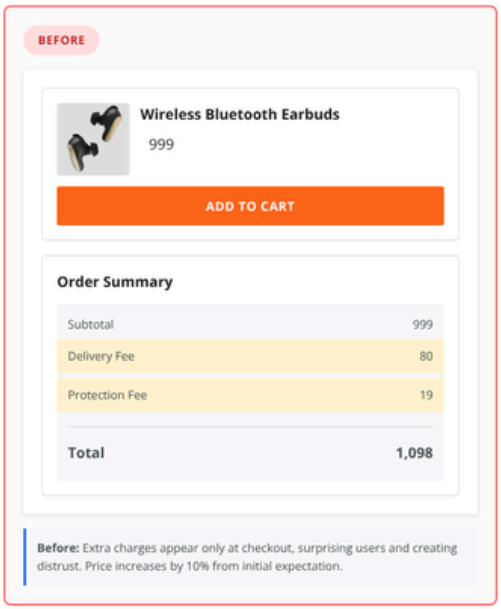
Why this is a problem

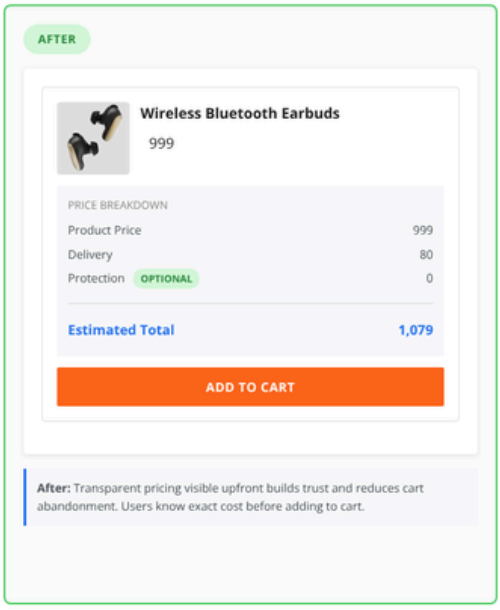
Unexpected costs are a major reason users abandon carts.

Research shows hidden costs and late pricing information frustrate users and reduce conversions.

Problems:

- Users feel tricked.





Benefits

- Transparent pricing
- Builds trust
- Fewer abandoned carts
- Transparency is one of the key principles of better cart UX.

Additional Info: Platform fees and similar charges can feel petty when multiplied across many small items. While such fees are necessary, consolidating them into a few meaningful, medium-sized fees would create a cleaner, more understandable system for users. This approach could improve transparency and the overall experience.

UX Problem #3 — Weak Trust Signals

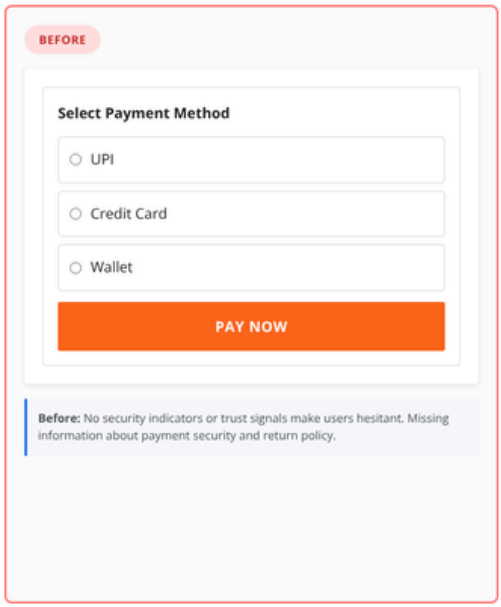
Why this is a problem

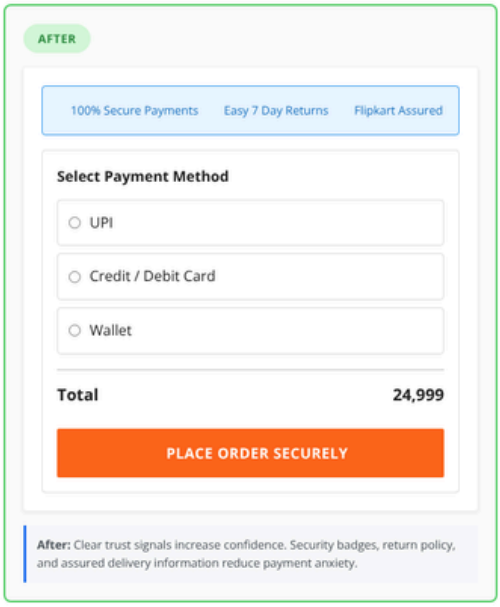
Users often hesitate during payment if they cannot see security signals.

Trust indicators like secure payment icons and return policies increase user confidence and conversions.

Problems:

- No reassurance.





Benefits

- Improves trust
- Reduces payment hesitation
- Improves conversion

These are just mockup ideas for ideation, not necessarily the best or final solutions. You can refer to the mockups here: [Github Pages > Runarok > GenAI-plus > Coursework > UX Mockups]

Heuristic UX Audit

Heuristic	Observation	UX Issue	Recommendation
Visibility of system status	Loading feedback present	Order status unclear	Add tracking updates
User control & freedom	Cart editing allowed	Removing items unclear	Add clearer delete option
Consistency	UI mostly consistent	Checkout pages slightly different	Standardize layout

Even well-designed platforms can benefit from small usability improvements that enhance the overall user journey.

CTA Clarity Review

Important CTAs:

- Add to Cart
- Buy Now
- Checkout

Issues

- Multiple buttons compete visually
- No clear primary action

Solution: Use Color Hierarchy.
Primary CTA: Add to Cart
Secondary CTA: Add to Wishlist

A/B Testing Proposal

Test	Version A	Version B	Goal
Checkout	Multi-step	One page	Reduce friction
CTA	Blue	Orange	Increase clicks
Product info	Long text	Bullet highlights	Improve readability

Metrics:

- Add to cart rate
- Checkout completion
- Conversion rate

Conclusion

The UX audit of Flipkart highlights several usability strengths while also identifying areas that can be improved to enhance conversion rates. Simplifying the checkout process, improving pricing transparency, and strengthening trust signals can significantly reduce friction during the purchasing journey.

Implementing these improvements may lead to higher customer satisfaction and better overall e-commerce performance.
