Diploma in UX Design

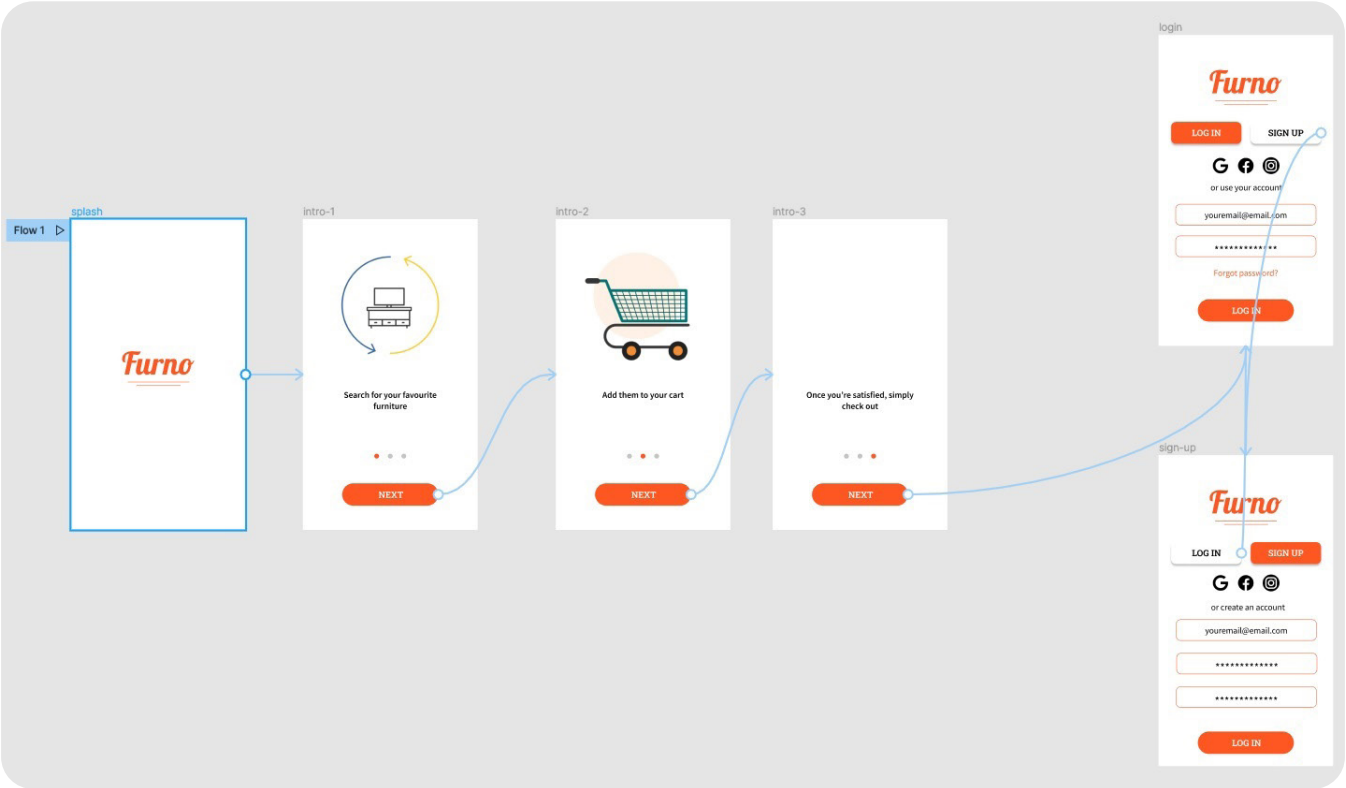
E-commerce prototype: Validation logic

Summary Notes

Lesson objectives

By the end of this lesson, you should be able to:

- **Understand conditional logic**
- **Design sign up and log in screens**

Figma demo


In this lesson we extend the functionality of our prototype by developing the authentication screens used for logging in and signing up to the ecommerce application. We briefly dive into the principle of conditional logic to design these screens given that user authentication is a common and important feature in e-commerce applications. Both screens include a basic form which consists of several text fields (username and password) and buttons to perform the authentication process.
