Diploma in UX Design

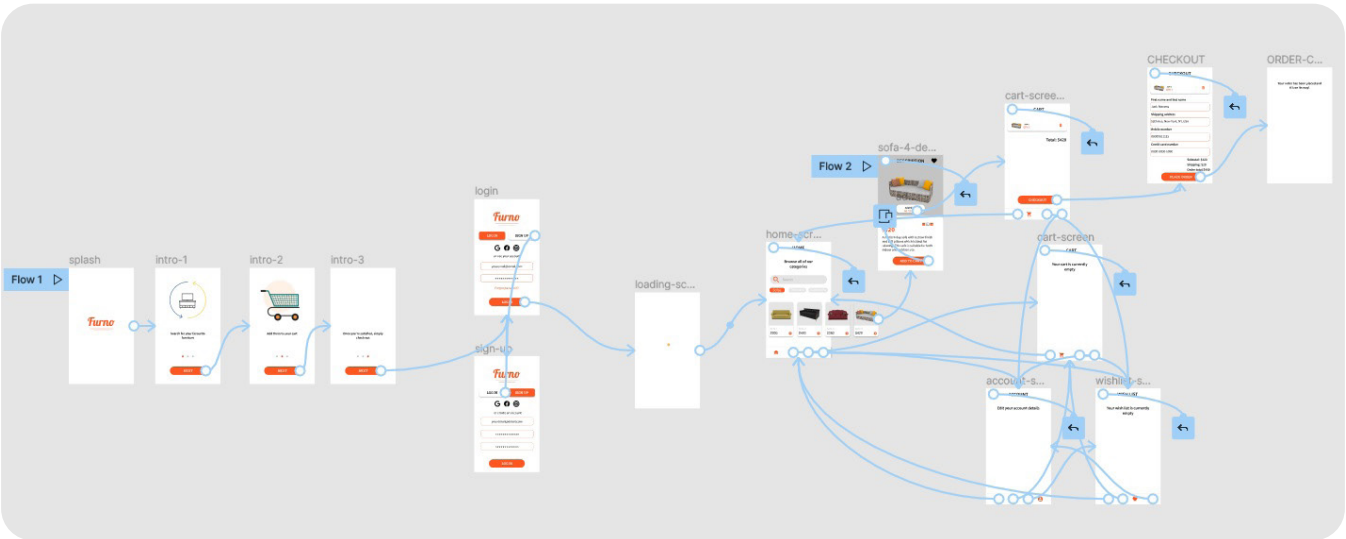
E-commerce prototype: Transaction flow

Summary Notes

Lesson objectives

By the end of this lesson, you should be able to:

- **Design cart functionality**
- **Create check out logic**
- **Finalise the prototype**

Figma demo


In this lesson we wrap up our e-commerce prototype with the core functionality behind the shopping process. The home screen includes a search bar element to simulate product filtering and a horizontal scroll bar to navigate between several products. Once the user selects a product, a detailed description of the product is displayed with a user-interface designed to add the item to the cart. After reviewing the cart items our prototype continues to finalise the e-commerce experience by collecting customer details with use of text fields (name, shipping address, mobile number and credit card details). After submitting the customer details the checkout process is completed and the user is notified that the order has been received.
