

GAME DESIGN

This section of the document contains the notes I prepared during my 8th semester internship, where my focus shifted toward learning and gaining practical experience in Game Design with an emphasis on user experience (UX).

Building on the earlier foundation in core computer science concepts and UX principles, this phase of the internship emphasized understanding player-centered design, engagement mechanics, and the process of crafting intuitive and immersive gameplay experiences.

As part of the program, the learning here focused on areas such as player psychology, game mechanics design, level design, interaction design, and applying problem-solving skills to enhance usability, accessibility, and overall player satisfaction within games.
