Diploma in UX Design

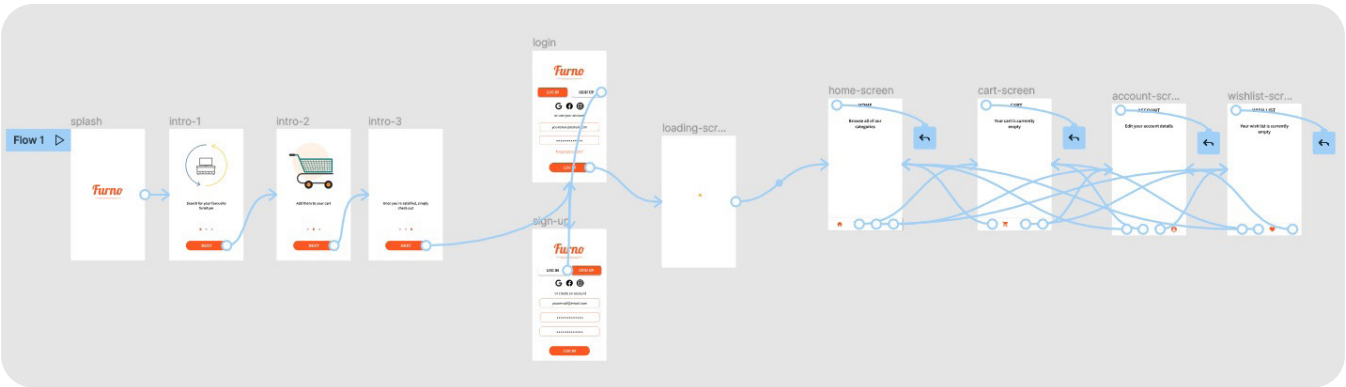
E-commerce prototype: Global navigation

Summary Notes

Lesson objectives

By the end of this lesson, you should be able to:

- **Design a global menu**
- **Implement global menu flow**

Figma demo


In order for users to navigate between application screens a global navigation bar was embedded and styled as a shared component across the relevant screens. Common screens found in e-commerce applications may include a Home, Cart, Account and Wish List screen – these were screens developed for this prototype. The transition between screens adopted conditional logic in that each icon button in the navigation bar directs the user to one of the above screens to manage their global shopping experience. A loading screen was also included to simulate the process of fetching data in the back-end when the user performs the sign in or log in process.
